and Technology

FoodWaStop Guidelines for valorisation of fruit, vegetable, cereal and animal product processing side-streams - an update

László Abrankó

Hungarian University of Agriculture and Life Sciences (MATE)

Institute of Food Science and Technology,

29-43 Villányi str. Budapest, 1118 Hungary

abranko.laszlo.peter@uni-mate.hu

3rd COST CA22134 FoodWaStop meeting

University of Zadar, Zadar, Croatia, 5-6, February, 2026

Evolution of the Guideline

- 2025 March (Córdoba) – Table of Content is proposed
- 2025 March – April – TOC -> open for discussion
- 2025 May – Outline is ready. First circular to recruit contributors
- 2025 June – First group of potential contributors
- 2025 September – Contributions are consolidated
- 2025 October – First formatted draft (v1)
- 2025 October – Templates for Annex 1 & 2 of D4.1
- 2025 December – 2026 January – consolidation of contributions
- 2026 February – Draft V2 is ready

Actual title:

GUIDELINES FOR VALORISATION OF **FRUIT, VEGETABLE, CEREAL AND ANIMAL** PRODUCT PROCESSING SIDE-STREAMS

Wide focus on various types of input material

However, narrow focus on the location of by-product generation

Manufacture of food and beverage production

Food waste in the EU by main economic sectors, 2023

(kg per inhabitant)

Retail and other distribution of food

10 KG

Primary production

12 KG

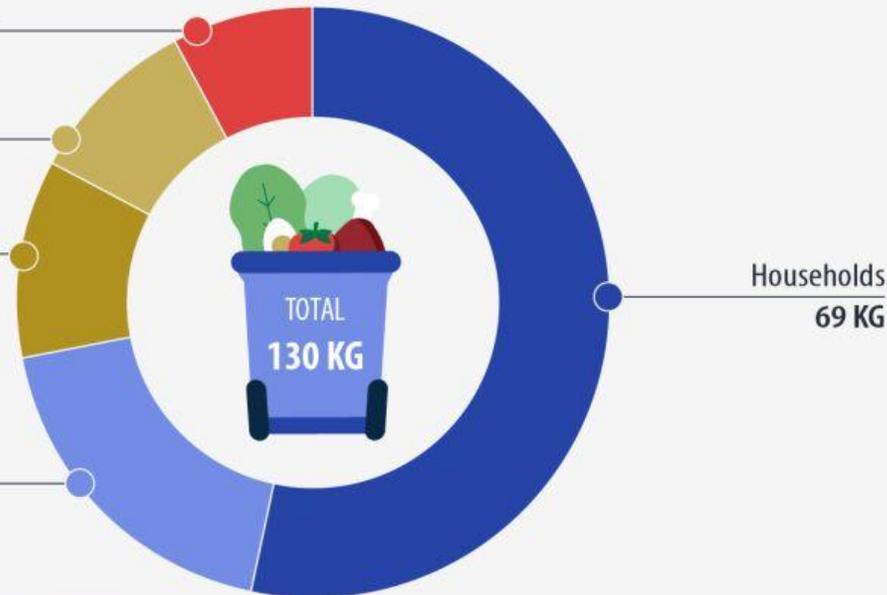

Restaurants and food services

14 KG

Manufacture of food products and beverages

24 KG

EU average: 18,5 %

- Production in industrial settings → *more controlled environment.*
- Continuous and reliable, centralised supply, rather than an arbitrary or sporadic occurrence.
- Predictable and tracable composition and timing.

EU aggregate: estimated. Data not available for Bulgaria, Spain, Lithuania and Romania. The difference between the sum of the categories and the total is due to rounding to the nearest unit, which is applied to each category and to the total.

Key areas covered in the document

Current Landscape and Challenges

Conceptual and Terminological Ambiguities

In food processing sector

Food waste typically denotes **discarded post-production food** that was originally intended for consumption.

waste

food

by-products and side streams

Side streams: refer to all substances or residual materials generated during primary food production that are not the primary intended food product. This term includes **waste, wastewater, by-products, and inedible fragments**.

By-products are a subset of side streams, generally unavoidable, residual products resulting from the material being processed. These by-products may be suitable for human consumption or other valorisation pathways (e.g., feed, bio-based materials, cosmetics).

Co-product implies that the secondary material is deliberately generated and retained under controlled conditions with the intention of being marketed or utilised as a product.

Regulatory compliance aspect: rather than referring to materials as “waste”, “by-products”, or “co-products”, the most desirable approach is to treat (co)-products simply as food, feed, or functional ingredients, depending on their intended use.

Key areas covered in the document

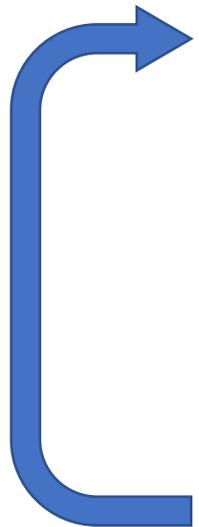

Valorisation as a Multi-step Value Chain

0th step: avoid loss and waste

Valorisation: add value and giving a new perspective to unavoidable by-products

Extraction of a valuable compound / fraction from a given biomass → key step, but only **part of the valorisation process**

Holistic valorisation approach:

- Appropriate collection
- Rapid stabilization
- (Optional) transformation, extraction and formulation
- Avoid premature energy recovery, when more efficient options are feasible
- Utilise (upcycle) in downstream products (food, cosmetics, feed, fertiliser etc.)

Traceability, maintenance of hygienic and safety aspects

Market-ready secondary, tertiary product

Downstream integration

Instead of reactive waste handling → proactive design of valorisation routes

Key areas covered in the document

Concept of multipurpose (zero waste) valorisation

Extraction, isolation and fractionation processes inherently generate secondary by-products

Apply a similar the multistep, holistic approach to these by-products / residues.

Avoid loss and waste

Design downstream integration

Concept of hierarchical valorisation

When designing valorisation pathways for food industry by-products, it is essential to validate targeted end-uses based on the following key criteria:

- **sustainability impact**
 - energy use, footprint → LCA (baseline → landfill)
 - emphasis on societal aspects and impacts of sustainability (population size that benefit)
 - preservation of biological complexity of the biomaterial → resource efficiency
- **circularity** → retain the original purpose of the primary product (food system proximity)
- **economic value potential**

Concept of hierarchical valorisation

Prioritization principles for the intended use of the by-product, from a circularity / food system proximity perspective.

Food upcycling

- This includes the recovery and utilisation of functional ingredients.

Feed Applications

- Feeding applications supports livestock or aquaculture creating food for human consumption.
- If direct feed use is not viable, side streams may be routed to insect rearing, where insects serve as feed ingredient for food-producing animals.

Plant and Soil Applications

- Returning nutrients to the agricultural system via composts, biostimulants, or fertilisers. These applications support food production indirectly by enhancing soil health and crop yield.

Non-agricultural applications

Energy recovery

- Priority might be given to material uses that support the food system, such as packaging.

Key amendments to this hierarchy:

Lower-tier options (e.g. composting) might be more sustainable or economically more practical.

Subsidised energy recovery pathways frequently diverts valuable by-products from more circular uses.

Nutraceutical and cosmetic ingredients may not represent the most sustainable pathways, yet they frequently provide the financial backbone that enables cascading biorefineries.

Example: high economical interest cosmetic ingredient vs. composting

Multi-criteria value assessment tools are recommended

Further topics covered in the document

Regulatory aspects: novel food, food safety, ultra processed food

Annexes to the main document

1) Case studies

A short 3-5 page document that provides an overview of the utilization opportunities and current practices of a given by-product type.

A structured template (prepared by Sarah Milliken) has been created.

10 "Case studies" have been created so far.

1. Introduction
2. Context and Baseline
3. Cascading Valorisation Pathways According to Food Use and Waste Hierarchy
 - Stage 1: Direct Food Use
 - Stage 2: Feed and Biochemical Valorisation
 - Stage 3: Non-food Valorisation
 - Stage 4: Energy Recovery and Disposal
4. Valorisation Challenges
 - 4.1 Infrastructure and Logistics
 - 4.2 Scale and Economic Viability
 - 4.3 Technical and Processing Challenges
 - 4.4 Environmental and Regulatory Issues
 - 4.5 Supply Chain and Collaboration Gaps
 - 4.6 Product Development and Marketing Challenges
5. Sustainability Assessment
6. Conclusions and Outlook

Completed case studies (January 2026)

No	Title	Author	Affiliation

Case Study: Valorisation of Grape Pomace as a Functional Feed Ingredient

1. Introduction

Rosa canina seed is an important agro-industrial waste with significant volume. The levels of crude protein in Rosa canina seed become a valuable feed ingredient for Rosa canina seed by animal feed. Morkaraman lam is a processing waste.

2. Context and Baseline

- Rosehip seed
- Rosa canina seed contribute
- The base

Case Study: Valorisation of Grape Pomace as a Functional Feed Ingredient

1. Introduction

Orange essential oil is considered a high-value product. Its oil is rich in antimicrobial compounds for food, cosmetic

2. Context and Baseline

The production of orange essential oil processor. Large quantities of orange essential oil are efficiently recovered from simpler or seed

essential oil extraction are often diverted into animal feed, compost, or low-value applications. (Mamma et al., 2014). The regulatory environment requires strict quality control for food- and cosmetic-grade oils, especially regarding oxidation products such as limonene oxide. From a

- Typically: 4 pages-long
- Follows the structure of the template
- Contains literature references!!
- Ideally not an extract of a single research paper, but neither a comprehensive review

Case Study: Valorisation of Grape Pomace as a Functional Feed Ingredient for Ruminants

1. Introduction

Grape pomace (GP) is the major solid by-product generated during wine and grape juice production. It consists of grape skins, seeds, and small stems remaining after pressing. GP represents up to 20–25% of the original grape weight, making it one of the largest fruit-processing waste streams globally. Rich in polyphenols, tannins, fibres, oils, vitamins, and natural antioxidants, GP shows high potential as a functional feed ingredient for ruminants. Recent studies (MDPI, 2024) demonstrate that GP inclusion enhances antioxidant status, reduces lipid oxidation in meat and milk, and may partially replace conventional feed ingredients, contributing to circular bioeconomy and waste reduction.

2. Context and Baseline

Wine and grape juice industries produce millions of tonnes of GP annually. Traditionally, disposal methods have included:

- Land spreading

Case Study: Valorisation of Grape Pomace as a Functional Feed Ingredient

1. Introduction

Bee bread (perga) is a natural product. During extraction and processing, high-value ingredients are typically recovered from waste streams.

2. Context and Baseline

Bee bread waste arises from the production of granules, and comb replacement. It is a low-grade feed. Driven by the presence of natural antioxidants, a

3. Cascading Valorisation

(MDPI, 2024)

- Stage 1: Direct Food Use
- Milling, powder incorporation

Prepared by:
Email: abra
Year: 2025

Case Study

1. Introduction

- Overview

2. Context and Baseline

- Description

Apple pomace is a waste product from apple processing. Different apple varieties are applied, but the waste is often from small-scale operations annually.

- Current status
- Animal feed

Pomace is commonly used for animal feed.

Annexes to the main document

1) Case studies

2) Industrially implemented solutions

A very short, 1-2 page document that introduces a company or project that deals with the processing and utilization of agri-food by-products.

A very important criterion is that we only want to include solutions that are already operational on an industrial scale.

These documents are created for informational purposes and do not imply commercial involvement, operational commitments, or representation of any company.

Annexes to the main document

Guidelines for new valorisation strategy – supplementary information on industrially implemented solutions

Guidelines for new valorisation strategy – supplementary information on industrially implemented solutions

Prepared by: *László Abrankó – Hungarian University of Agriculture and Life Sciences (MATE)*

Email: *abranko.laszlo.peter@uni-mate.hu*

Year: 2025

Note: This document provides a scientific contribution for COST Action CA22134 Deliverable D4.1. It does not imply commercial involvement, operational commitments, or representation of any company

1. Company/Project Name:

Grapoila

2. Location:

Hungary, H-1224 Budapest, Szakiskola str. 33-43.

3. Website / Contact Info:

Link to the company/project website or contact for further info.

<https://grapoila.hu>

info@grapoila.hu, info@virginoilpress.hu,

4. Description:

A brief overview of the company/project, its mission, and relevance to food waste valorisation.

26 documents are completed so far

There are still more companies (not only EU) waiting to be introduced using the template .

More interesting "Case studies" are welcome.

Contributions are still welcome
